## HEALING SCHEDULE FOR PERMANENT MAKEUP EYEBROWS/MICROBLADING

### DAY 1-2

You will see about 20-40% darker, bolder, and more solid than what your healing results will be. Under the pigment the skin is red and the pigment has been deposited into the dermal layer of skin coating dead skin cells; combined giving the appearance of a darker color. There may be minimal swelling, because typically the eyebrow area does not retain much fluid, swelling will be minimal.

### Day 3-4

The top layers of skin will begin to shed and you will see a loss of color. This is normal, and pigment that was deposited specifically will shed off with the skin it is embedded within.

**DO NOT HELP IT! Let it peel on its own!** If you pull the skin off, you will remove “plugs” of dermal pigment as it has not detached itself completely at this point. Your eyebrows may begin to itch and the pigment may appear somewhat raised, **DON'T SCRATCH THEM!**

### DAY 5-6

The skin is now in the process of rapid exfoliation and if left alone, will shed evenly. The color under the exfoliating skin will continue to appear light until the epidermis takes on its more transparent characteristics.

### DAY 30-40

Now is the time to critique your brow. As you have had a full cycle of cellular regeneration in which the tattoo has now become part of the dermis, seen under the epidermis.

### NOTE:

The outcome of permanent cosmetic procedures is dictated by its canvas. The better the condition your skin is in, the better the final results will be.

Dry, sun damaged skin are very difficult to achieve a beautiful even result.

Mature clients may need an additional procedure onto two weeks healing for the final results to appear.

The better you take care of your skin and protect it from UV rays, the better the outcome and lifespan of the permanent cosmetic procedure.
